

3D Geometry and Mesh Data Structures

1. Draw a picture of a triangulated polygon that can be drawn using a single triangle fan but not a single triangle strip. No degenerate triangles can be used.
2. Draw a picture of a triangulated polygon that can be drawn using a single triangle strip but not a single triangle fan. No degenerate triangles can be used.
3. Suppose a triangle has a normal vector of $\langle 1, 1, 0 \rangle$ and that the vector for the view direction is $\langle 1, -2, 0 \rangle$. Is the triangle front-facing or back-facing?

4. The following vertex buffer is suitable for drawing 3 triangles using `gl.TRIANGLES` and `gl.DRAW_ARRAYS`. Convert the buffer to one suitable for drawing the same triangles using `gl.TRIANGLE_STRIP` and `gl.DRAW_ARRAYS`. Assume we are using a CCW winding order.

5. The Euler Characteristic

The Euler Characteristic states the following relationship for the elements of a closed and connected surface mesh:

$$V - E + F = 2(1 - G)$$

V is the number of vertices

E is the number of edges

F is the number of faces

G is the genus of the surface (how holes/handles it has)

Show that for a triangle mesh with no holes we have $F \approx 2V$. Hint: each face has 3 edges and each edge is shared by 2 faces.

Memory Requirements

Using the fact that $F \approx 2V$, compare the storage requirements for an indexed face mesh and a triangle soup (in WebGL this corresponds to using `gl.drawElements` versus `gl.drawArrays`). Assume the mesh has V vertices and a number requires 4 bytes of space. Derive functions for the number of bytes the mesh will require as a function of V .
